Dental implants for functional teeth

Functional teeth are retained by their roots – or by implants!

...Dental Implants, a comfortable solution!
Loss of natural teeth – the reasons are as diverse as human beings – causes considerable restrictions in your daily life, for instance enjoying dinner or a nice social evening, to tell a person that you feel affectionate – with a smile, to be sure to be in the center of life.

For more than 25 years we have been working towards better prospects for you – and with success: Your smile is the nicest compliment.

"A winning smile is part of your positive appearance – to be actively in the center of the professional world, to contribute your share – does this work with third teeth?"

"To forget that I am wearing dentures? To eat naturally and to smile without fear that the dentures might move – is this possible?"

Patient Information

What benefits will dental implants offer?

“There is nothing better than your own natural teeth!”

If you, however, for one reason or another stand at the brink of making a decision for choosing a tooth replacement, you principally have two choices: the first would be dentures. This artificial prosthesis rests on the toothless jaw bone, but does not find a true stability. The patient feels he is wearing a foreign body in his mouth.

The second choice is a convincing alternative: dental implants replace the tooth root and serve as stable support of the crowns or bridges. This means: **Dental implants offer a permanent fixed tooth replacement.** Not only the appearance, but also the safe feeling of natural teeth is restored.

Another advantage of **dental implants is the prevention of early bone resorption.** When teeth are missing, the bone will resorb due to lack of stimulation by chewing, same as with dentures. The result: The prosthesis will not find retention. This is not the case with dental implants.

The chewing function remains completely, the bone is stimulated constantly, there is no bone resorption, on the contrary, bone will regenerate. The food can be prepared naturally again, **“internal consequences”** such as disturbance of the digestive system are avoided.

In which cases are dental implants recommended?

The complex implant systems offer multiple solutions, for part of the jaw or complete jaw restorations. Dental implants are the treatment of choice in cases of single tooth replacement, especially in case of an accident. Traditional dentures would require the trimming of healthy neighboring teeth for the artificial crown. Dental implants save the adjacent natural teeth. **Therefore, dental implants are recommended for any age.**

Which conditions and risks should be considered?

The optimal care of your own teeth should be an important goal for your health. **Dental implantation** requires not only healthy bone of sufficient quantity, but also excellent oral hygiene. A pre-check-up of your physician or internist – especially with regard to common health problems such as high blood pressure, diabetes etc. – and regular recall “post-op” check-ups after the implantation and control of the occlusion, i.e. the bite position of your teeth in both jaws, are recommended.

Which material do they consist of?

The implants of Sybron Implant Solutions are exclusively made of pure **Titanium**. The human body accepts titanium, a totally resistant material, completely. It is biocompatible and stable.

What are dental implants?

A dental implant is an artificial tooth root. Where normally the own root gives the tooth stability, the new “root” is inserted directly into the jaw bone, i.e. implanted.

In the same way as **natural roots** retain the teeth, implants can support either individual crowns or bridges over the complete jaw, or a bridge which is connected to the remaining natural teeth. This way, you will have fixed permanent teeth again.

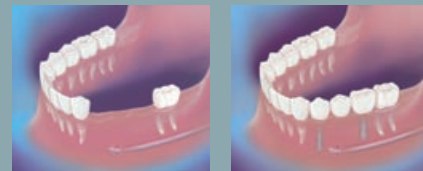

Who will take care of the costs?

Dental implantology is an accepted science. The costs for dental implants are somewhat higher than for single artificial crowns or bridges. Ask your dentist for details.

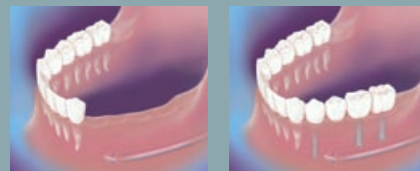

A comparison is recommended, as dental implants can be more economic than conventional dentures.

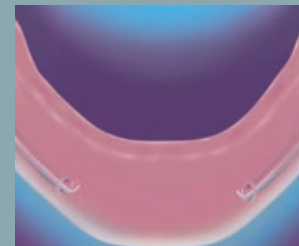

Single tooth replacement

Restoration of large interdental gaps

Free-end support

Complete jaw restoration
